

PROJECT5 2D3DARRAYS

INSTRUCTIONS:

1. CREATE A NEW FOLDER PRJOECT5_MDARRAY_SECTION#
2. INSIDE THE NEWLY CREATED FOLDER CREATE A NEW PROJECT FOR EXAMPLE,

- ### 3. DEFINE A FUNCTION THAT WILL DISPLAY THE SAMPLE LAYOUT FOR YOUR MENUWINDOW()

```

~~~~~ 2D AND MULTI-DIM ARRAY ~~~~~

[T]ranspose Matrix
[M]ulti-dimensional Array
[E]xit

Enter valid choice [TME]only:

```

4. Define and implement the following functions:

A. ***Transpose the Matrix

You will be given (as user's input) the number of rows, and columns in a matrix (also called an array), followed by the numbers in the matrix, one row of numbers per line. Your job is to transpose the matrix: the rows become the columns and the columns become the rows. Continue reading and transposing matrices until the number of rows and/or columns given is zero. All numbers are non-negative integers. Elements of the array will be single-digit numbers. Skip a line between matrices.

Define function(s) that will implement the above problem using two-dimensional array.

Example inputs:

Test data 1:

Output:

6 3 8
5 6 9

6	5
3	6
8	9

Test data 2:

1	2
3	4
5	6
7	8

Output:

1 3 5 7
2 4 6 8

- B. **** Create a multi-dimensional array that will simulate the given output layout below. Use the given values in each table to set the initializers / data values in the array.

10	12	14
16	18	20
22	24	26

1	2	3
4	5	6
7	8	9

11	13	15
17	19	21
23	25	27
8	10	12
14	16	18
20	22	24

Write print statements to simulate the output given above: (using array elements given above)
